Hardware and Software

Deep Learning Hardware, Dynamic & Static Computational Graph, PyTorch & TensorFlow

Объявление:

6235 - 30/10/2020 в 11-30 (СМР) контрольная работа на 45 минут

Три задачи:

1. Расчет функции потерь по матрице оценок классификатора, функция потерь или SoftMax или SVM.
2. Расчет прямого и обратного распространения по графу сети.
3. Расчет выхода для сверточной сети.

Данные по нескольким вариантам.

Задача на дом:

Входное изображение: CONV фильтр:

```
[1 2 3 4 5]
[2 2 1 1 1]
[3 2 1 1 1]
[4 1 1 1 1]
[5 1 1 1 1]
```

```
[0 -1 0]
[1 1 1]
[0 -1 0]
```

Посчитать выход сети: conv(depth=1, stride=2) -> ReLU -> MaxPool

Решение:

Вход:

$$1) \begin{bmatrix} 1 & 2 & 3 & 4 & 5 \\ 2 & 2 & 1 & 1 & 1 \\ 3 & 2 & 1 & 1 & 1 \\ 4 & 1 & 1 & 1 & 1 \\ 5 & 1 & 1 & 1 & 1 \end{bmatrix}$$

conv:

$$\begin{bmatrix} 0 & -1 & 0 \\ 1 & 1 & 1 \\ 0 & -1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & -2 \\ 3 & 1 \end{bmatrix}$$

conv(strides=2)

$$2) \begin{bmatrix} 1 & -2 \\ 3 & 1 \end{bmatrix} \cdot \text{max Pool}(2) = \underline{\underline{3}}$$

Еще примеры задач:

Матрица оценок
классификатора:

[2.1 1.6 2.1]
[3.0 3.2 2.8]
[-2 3.7 3.8]

Посчитать:

1. Функцию потерь мультиклассового SVM
2. Функцию потерь для SoftMax

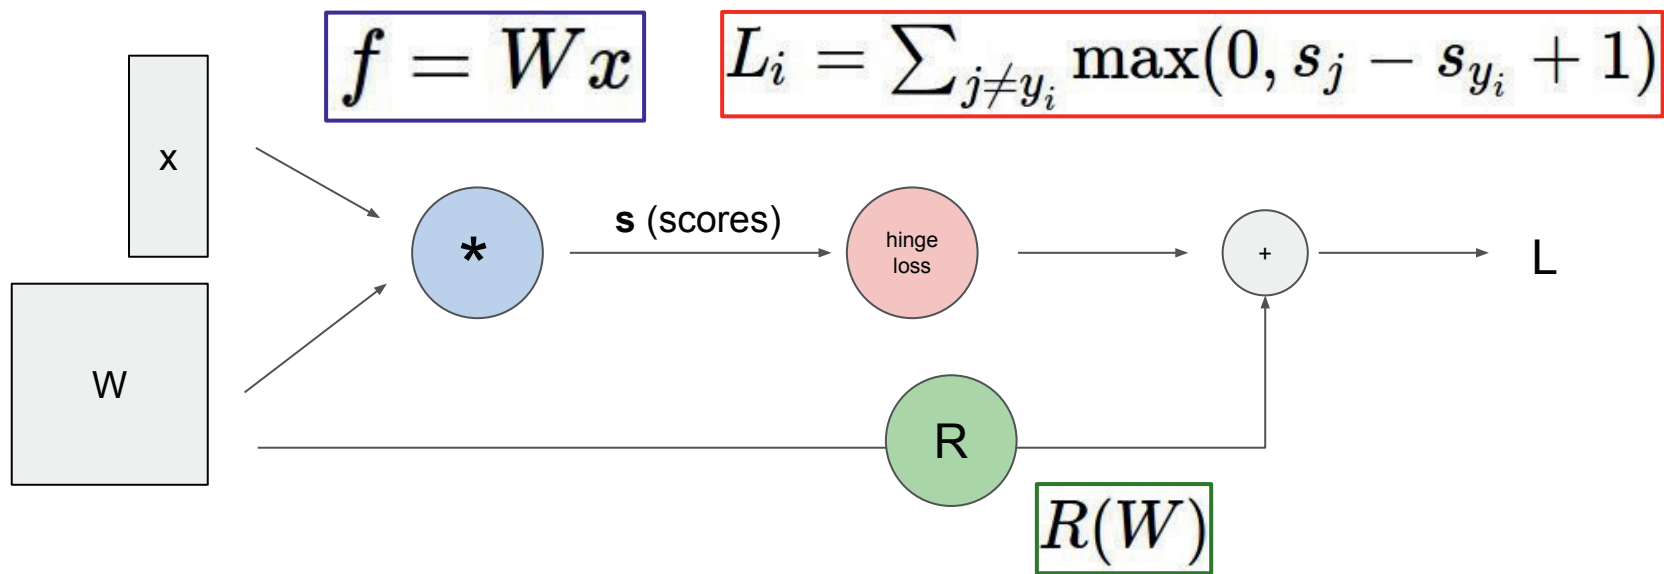

3. Для заданной функции и входов посчитать прямое
и обратное распространение по сети.

При обратном распространении на входе считать градиент равным 1.

$$f(w, x) = \frac{1}{1 + e^{-(w_0x_0 + w_1x_1 + w_2)}} \quad \begin{array}{l} w_0 = 1, w_1 = -2, w_2 = 1 \\ x_0 = -1, x_1 = 1 \end{array}$$

Programming GPUs

- CUDA (NVIDIA only)
 - Write C-like code that runs directly on the GPU
 - Optimized APIs: cuBLAS, cuFFT, cuDNN, etc
- OpenCL
 - Similar to CUDA, but runs on anything
 - Usually slower on NVIDIA hardware
- HIP <https://github.com/ROCm-Developer-Tools/HIP>
 - New project that automatically converts CUDA code to something that can run on AMD GPUs

Solutions:

- Read all data into RAM
- Use SSD instead of HDD
- Use multiple CPU threads to prefetch data

Check out the [model zoo documentation](#) for details.

To acquire a model:

1. download the model gist by `./scripts/download_model_from_gist.sh <gist_id> <dirname>` to load the model metadata, architecture, solver configuration, and so on. (`<dirname>` is optional and defaults to `caffe/models`).
2. download the model weights by `./scripts/download_model_binary.py <model_dir>` where `<model_dir>` is the gist directory from the first step.

or visit the [model zoo documentation] (http://caffe.berkeleyvision.org/model_zoo.html) for complete instructions.

The point of deep learning frameworks

- (1) Quick to develop and test new ideas
- (2) Automatically compute gradients
- (3) Run it all efficiently on GPU (wrap cuDNN, cuBLAS, OpenCL, etc)

Computational Graphs

Numpy

```
import numpy as np
np.random.seed(0)

N, D = 3, 4

x = np.random.randn(N, D)
y = np.random.randn(N, D)
z = np.random.randn(N, D)

a = x * y
b = a + z
c = np.sum(b)
```

Good:

Clean API, easy to write numeric code

Bad:

- Have to compute our own gradients
- Can't run on GPU

PyTorch: Dynamic Computation Graphs

Building the graph and **computing** the graph happen at the same time.

Seems inefficient, especially if we are building the same graph over and over again...

```
import torch

N, D_in, H, D_out = 64, 1000, 100, 10
x = torch.randn(N, D_in)
y = torch.randn(N, D_out)
w1 = torch.randn(D_in, H, requires_grad=True)
w2 = torch.randn(H, D_out, requires_grad=True)

learning_rate = 1e-6
for t in range(500):
    y_pred = x.mm(w1).clamp(min=0).mm(w2)
    loss = (y_pred - y).pow(2).sum()

    loss.backward()
```

Static Computation Graphs

Alternative: **Static** graphs

Step 1: Build computational graph describing our computation (including finding paths for backprop)

Step 2: Reuse the same graph on every iteration

```
graph = build_graph()
```

```
for x_batch, y_batch in loader:  
    run_graph(graph, x=x_batch, y=y_batch)
```

TensorFlow

TensorFlow Versions

Pre-2.0 (1.14 latest)

Default static graph,
optionally dynamic
graph (eager mode).

2.1 (March 2020)

Default dynamic graph,
optionally static graph.

We use 2.1 in this class.

TensorFlow: Neural Net (Pre-2.0)

```
import numpy as np
import tensorflow as tf
```

(Assume imports at the top of each snippet)

```
N, D, H = 64, 1000, 100

y = tf.placeholder(tf.float32, shape=(N, D))

y = tf.convert_to_tensor(np.random.randn(N, D), np.float32)
model = tf.keras.Sequential()

Keras: High-Level Wrapper

Define model as a sequence of layers

```
N, D, H = 64, 1000, 100

x = tf.convert_to_tensor(np.random.randn(N, D), np.float32)
y = tf.convert_to_tensor(np.random.randn(N, D), np.float32)
model = tf.keras.Sequential()
model.add(tf.keras.layers.Dense(H, input_shape=(D,),
                                activation=tf.nn.relu))
model.add(tf.keras.layers.Dense(D))
optimizer = tf.optimizers.SGD(1e-1)
```

Get output by calling the model

```
losses = []
for t in range(50):
    with tf.GradientTape() as tape:
        y_pred = model(x)
        loss = tf.losses.MeanSquaredError()(y_pred, y)
```

Apply gradient to all trainable variables (weights) in the model

```
gradients = tape.gradient(
    loss, model.trainable_variables)
optimizer.apply_gradients(
    zip(gradients, model.trainable_variables))
```

Keras: High-Level Wrapper

Keras can handle the training loop for you!

```

Static vs Dynamic: Optimization

With static graphs, framework can **optimize** the graph for you before it runs!

The graph you wrote

Equivalent graph with **fused operations**

Static PyTorch: ONNX Support

You can export a PyTorch model to ONNX

Run the graph on a dummy input, and save the graph to a file

Will only work if your model doesn't actually make use of dynamic graph - must build same graph on every forward pass, no loops / conditionals

```
import torch

N, D_in, H, D_out = 64, 1000, 100, 10
model = torch.nn.Sequential(
    torch.nn.Linear(D_in, H),
    torch.nn.ReLU(),
    torch.nn.Linear(H, D_out))

dummy_input = torch.randn(N, D_in)
torch.onnx.export(model, dummy_input,
                  'model.proto',
                  verbose=True)
```

Static PyTorch: ONNX Support

```
graph(%0 : Float(64, 1000)
      %1 : Float(100, 1000)
      %2 : Float(100)
      %3 : Float(10, 100)
      %4 : Float(10)) {
  %5 : Float(64, 100) =
onnx::Gemm[alpha=1, beta=1, broadcast=1,
transB=1](%0, %1, %2), scope:
Sequential/Linear[0]
  %6 : Float(64, 100) = onnx::Relu(%5),
scope: Sequential/ReLU[1]
  %7 : Float(64, 10) = onnx::Gemm[alpha=1,
beta=1, broadcast=1, transB=1](%6, %3,
%4), scope: Sequential/Linear[2]
  return (%7);
}
```

```
import torch

N, D_in, H, D_out = 64, 1000, 100, 10
model = torch.nn.Sequential(
    torch.nn.Linear(D_in, H),
    torch.nn.ReLU(),
    torch.nn.Linear(H, D_out))

dummy_input = torch.randn(N, D_in)
torch.onnx.export(model, dummy_input,
                  'model.proto',
                  verbose=True)
```

After exporting to ONNX, can
run the PyTorch model in Caffe2

Static PyTorch: ONNX Support

ONNX is an open-source standard for neural network models

Goal: Make it easy to train a network in one framework, then run it in another framework

Supported by PyTorch, Caffe2, Microsoft CNTK, Apache MXNet

Model Parallel vs. Data Parallel

Model parallel: split computation graph into parts & distribute to GPUs/ nodes

Data parallel: split minibatch into chunks & distribute to GPUs/ nodes

Model Parallel

Data Parallel

PyTorch: Data Parallel

`nn.DataParallel`

Pro: Easy to use (just wrap the model and run training script as normal)

Con: Single process & single node. Can be bottlenecked by CPU with large number of GPUs (8+).

`nn.DistributedDataParallel`

Pro: Multi-nodes & multi-process training

Con: Need to hand-designate device and manually launch training script for each process / nodes.

Horovod (<https://github.com/horovod/horovod>): Supports both PyTorch and TensorFlow

<https://pytorch.org/docs/stable/nn.html#dataparallel-layers-multi-gpu-distributed>

TensorFlow: Data Parallel

tf.distributed.Strategy

```
strategy = tf.distribute.MirroredStrategy()

with strategy.scope():
    model = tf.keras.Sequential([
        tf.keras.layers.Conv2D(32, 3, activation='relu', input_shape=(28, 28, 1)),
        tf.keras.layers.MaxPooling2D(),

        tf.keras.layers.Dense(64, activation='relu'),

PyTorch vs. TensorFlow: Industry

- No official survey / study on the comparison.
- A quick search on a job posting website turns up 2389 search results for TensorFlow and 1366 for PyTorch.
- The trend is unclear. Industry is also known to be slower on adopting new frameworks.
- TensorFlow mostly dominates mobile deployment / embedded systems.

My Advice:

PyTorch is my personal favorite. Clean API, native dynamic graphs make it very easy to develop and debug. Can build model using the default API then compile static graph using JIT.

TensorFlow is a safe bet for most projects. Syntax became a lot more intuitive after 2.0. Not perfect but has huge community and wide usage. Can use same framework for research and production. Probably use a high-level framework.
